

ROLLABLE WATERING TUBE

Abstract

A device for watering vegetation has a cylindrical tube that can be laid flat and rolled up. The tube has a watertight seal about 2 to about 6 inches from each end, which leaves a flap at each end. The flaps can be attached to stakes that can be driven into the ground. There are one or two openings along the length of the tube through which water can be admitted into the tube. At or near the bottom of the tube is at least one drip emitter from which water can leave the tube. Two or more tubes can be joined together using a single stake through the flaps of the tubes. The tubes can be arranged in a line, a circle, or other arrangements.
